2001 FFA

State Crops Contest Exam Agronomy Quiz Questions: Corn and Oats

Corn:

1. As a crop, corn is a member of the	family.
a. composite	c. legume
b. grass	d. nightshade
2. Corn grain contains high concentrations of	of:
a. protein	c. vitamins
b. oil	d. starch
3. Corn is thought to have originated as a sp	ecies in:
a. U.S. and Canada	c. England and Western Europe
b. Mexico and Central America	d. India
4. Because of corn's reaction to temperature	e, it should not be planted in the spring until the soil
temperature in the planting zone reaches	
a. 45	c. 65
b. 50	d. 86
5. Corn seed is treated with a to p soils.	protect it against rotting when planted in cold wet
a. fungicide	c. insecticide
b. herbicide	d. Miticide
6. The (plant part) protects the l	eaves of the corn plant during germination of the
seed until it emerges from the soil.	
a. coleoptile	c. epicotyl
b. cotyledons	d. mesocotyl
•	_ inches in any soil type with good emergence.
a. one b. two	c. three d. four
	s per acre on a clay loam soil, high fertility with good
water holding capacity would be appropri	
a. 5,000	c. 28,000
b. 14,000	d. 52,000
,	they are at the 3 or 4 leaf stage of development will
probably:	timely also at the controller of the companions with
a. die	c. recover, but with a large yield loss
b. not die, but fail tog row any more	
10. Corn's need for phosphorous fertilizer c	
a. last year's crop yield	
b. this year's anticipated yield	d. soil test
· · · · · · · · · · · · · · · · · · ·	nt in determining the nitrogen needs of corn:
a. relative maturity rating of hybrid	c. yield goal of the crop
b. soil organic matter content	d. date of planting
	t mobile in the soil allowing farmers to "sidedress"
corn with the nutrient and it will be avail	<u> </u>
a. nitrogen	c. potassium
b. phosphorous	d. iron
1 1	r acre if there is an average of 75 seedlings per 50
foot or row. The rows are 30 inches apa	0 0 1
a. 29,040 b. 26,136	c. 17,240 d. 11,616

14. The "growing point" of corn is first above t felt above the soil surface on the corn "stem	he surface of the soil when a(n) can be ,
a. first true leaf	c. internode
b. coleoptile	d. node
<u> </u>	xing bacteria (rhizobia), as is soybean seed. Why?
a. corn seed has adequate bacteria on th	
b. corn plants do not fix nitrogen as soy	
c. it is too time consuming and expensive	^r e
d. the soil has an abundant supply	
	ing brown and dying) from the tip down the mid-
rib is a good indication of a deficiency of:	
	um c. iron d. nitrogen
17. A good indicator of phosphorous deficiency	in corn is:
a. upper leaves turn purple	
b. a leaf, which develops alternate green	and white stripes
c. "firing" (brown and dying) down the	margin of lower leaves
d. "Buggy whipping" of upper leaves	
18. Corn plants turning yellow and dying in a p	oorly drained area with standing water is caused
primarily by a deficiency of to the p	olant.
	c. nitrogen gas (N ₂) d. carbon dioxide (CO ₂)
19. Weed seedlings are most susceptible to her	oicides when they are:
a. stunted due to drought	•
b. vigorous and actively growing	
c. deficient in nutrients, such as nitroge	n
d. slow growing due to cold weather	
	stems due to cultivation occurs when the plants
are at the stage of development.	stems are to easily allon occurs when the plants
	c. stem elongation (6-8 leaves)
a. young seedlings (3-4 leaves)b. tassel initiation (5-6 leaves)	d ear initiation (10-12 leaves)
	ot boom has applied 0.35 gal in 50 feet. What is
the rate of application in gal/acre of the spr	-
a. 5.1 b. 14.5	c. 30.5 d. 254.1
	Failure of a herbicide applied post-emergence to
control weeds:	untile of a herotetae applied post emergence to
a. tied up (adsorbed) by the clay and org	ranic matter of the soil
b. rate of application of herbicide is too	
c. weeds not susceptible to herbicide ap	
d. Round-up applied to Round-up Read	L.
23. The earliest measure or indicator of corn m	
a. grain dented	aturity is.
b. black layer on kernel is present	
c. husks are brown	
	an Iramal
d. "milk line" is about half way down the	
	ave to sell, if the net weight of grain on a truck is
50,400 pounds (assume 15.5 % moisture)	000 1.1.020
	900 d. 1.039
25. Corn for silage should be harvested when the	ie:
a. grain is at a black layer stage	
b. grain is in "milk" or roasting ear stag	
c. plant has reached maximum wet weig	
d. when the whole plant moisture is abo	ut 65%

O a		
26.	The scientific name of oats is:	
	a. avena sativa b. Glyc	ine max c, Triticum aestivum d. Zea mays
27.	Oat seed may be planted as soon a	as the soil temperature is approximately F at the depth
	of planting the seed.	
	a. 50-60	c. 30-32
	b. 35-40	d. 20-25
28.	Tillers in oats are secondary stem	s, which also produce grain and are produced from;
	a. extra embryos in the seed	
	b. coleoptile after it emerges	
	c. buds located in the crown o	f the plant
	d. apical bud located at the tip	
29.		be reduced when oats follow a legume crop rotation:
	a. nitrogen b. phosphorous	
30.		pounds per acre to ensure an adequate population for the
	maximum yields with April plant	
	a. 32 b. 48	c. 80 d. 120
31		ng and dying of the tissue along the edge of the oldest
<i>J</i> 1.	leaves, are probably suffering from	
	a. iron	c. phosphorous
	b. nitrogen	d. potassium
32		mergence to 3-leaf stage may be done using:
<i>5</i> 2.	a. field cultivator	c. row cultivators
	b. rotary hoe	d. spring tooth harrow
33	The rate of nitrogen fertilization i	• •
55.		
		c. variety grownd. yield goal of the producer
21		ow in Minnesota should consider genetic resistance to the
34.	•	ow in winnesota should consider genetic resistance to the
	major dieses known as:	a arown must
	a. bacterial blightb. purple leaf virus	c. crown rust
25	* *	1 7 1
33.		sphorous and potassium for maximum productivity of oats
	can best be determined by:	a daystayna af tha aail
	1 1	c. texture of the soil
20	b. organic matter content of the	
<i>3</i> 0.		post emergence weed control in oats must consider:
	a. organic matter content of thb. soil texture	e son
		- 1
	c. time of the year in which th	e nerbicide is to be applied
27	d. weed species present	1 1'6 1 6 4 4
37.		n the life cycle of oats to environmental stress is:
	a. early seedling growth	c. pollination and early seed development
20	b. tillering	d. after physiological maturity of the grain
38.	<u> </u>	are (i.e. maximum seed dry weight) when:
	a. the moisture content of the	
	b. the glumes and peduncle ha	
	c. the grain is hard as determi	
	d. the entire plant is harvest g	
39.		a grown oats is achieved when the crop is planted:
	1	c. June 10-20
	b. May 1-10	d. planting date is not important to grain quality

40.	Oats may be swathed without rec	luction in yield when the moisture content of the grain is
	approximately:	
	a. 30 %	
	b. 40 %	
	c. 50 %	
	· · · · · · · · · · · · · · · · · · ·	ovided the plant is given time to mature in the swath
41.	<u> </u>	placed directly into storage without further drying when the
	moisture content of the grain is a	11.
	a. 30 %	c. 15.5 %
	b. 20 %	d. 14 %
42.	A farmer's oats were discounted	for "heat damage" when they were sold. The most probable
	cause was:	
	a. high air temperatures outsi	-
		e field during the grain filling period
		field before the grain was harvested
40		by molds growing on grain in storage
43.	_	net weight of 12,800 pounds of grain on his truck. How
	many bushels of oats does the far	
	a. 229	c. 320
11	b. 267	d. 400
44.	a. color of oats	mining the market grade of oats offered for sale is:
		c. test weight of the oats (lbs./bushel)
15		d. probably use of the oats (feed or human feed) ed a field of oats and determined the following:
45.	Area sampled: 25 square feet	ed a field of oats and determined the following.
	Pounds of grain in the 25 square	foot area = 3 lbs
	-	nels per acre (acre = 43,560 sq. ft.)
	a. 75 b. 81	c. 109 d. 163
46	The term "groat" as used in oats	
	a. glumes covering the seed	Totals to.
	b. nutrient content of the grai	n
	c. the seed without the glume	
	d. secondary stems, also calle	-
47.	In marketing oats, the term "docl	
	a. grain damaged in storage	
	b. weed seeds, chaff, soil, etc	. removed from the grain
	c. oats directly from the com	oine without cleaning
	d. method of marketing the o	
48.	A farmer has inspected oats in a	storage bin and found rice weevil in the grain. The insects
	probably came from:	
	a. infested seed used to grow	•
	b. grain infested in the field b	
	c. insects located in the storage	
		ed from southern states (i.e. Texas)
49	Oats are members of the grass far	
~ ^	a. pulses b. cereals	c. oil seeds d. nurse crops
50.	Oat grain compared to other cere	_
	a. protein b. sugars	c. starch d. dietary fiber

Key – 2001 Crops Exam

2001 FFA State Crops Contest

Practicum # 1 Calibration of equipment (50 points)

You are applying fertilizer. Your soil test recommends 30 lbs. Of P (phosphorous) per acre. Your fertilizer dealer has the following forms of dry fertilizer available.

- a. diammonium phosphate (8-46-0) at \$339.00/ton
- b. super phosphate (0-19-0) at \$240.00/ton
- c. triple super phosphate (0-45-0) at \$265.00/ton
- A. Which fertilizer is the cheapest based on cost of nutrients provided per pound of fertilizer applied? (10 points)

In calibrating the fertilizer spreader on a trial run you determined 64 pounds was distributed on an area of 60 feet wide by the distance traveled in 2 minutes at 8 mph. Show your work. Right procedure, wrong answer = half credit.

- B. The area covered is? (10 points)
- C. Assume 33 lbs of commercial fertilizer was applied per acre. What is the amount (pounds) of actual P applied per acre for diammonium phosphate? (10 points) (Note: $P_2O_{5=0.43 P}$)
- D. Your spreader cart holds 3 ton of fertilizer. How many acres can you cover per cart at the calibration of 33 lbs/A? (10 points)
- E. The total amount of commercial fertilizer needed for a 72.2 acre field using triple super phosphate. (10 points)

Practicum # 2 (50 points)

You are a crop consultant assisting one of your clients with corn management problems. The seed to be planted has a germination of 90 %. A plant density of 28,000 plants per acre is desired.

- A. How many seeds should be planted per acre assuming that usually only 90 % of germinating seeds emerge? (8 points)
- B. At the two-leaf stage you are doing stand checks. You have made 10 counts with an average of 36 plants in 30 feet of row. The row spacing is 30 inches. What is the actual stand achieved? (Note: 43,560 sq feet per acre) (8 points)
- C. A less than desired stand was determined to be due to soil insects. Which of the following insects could be the problem? (Circle all potentially correct answers) (6 points)
- a. corn borer
- b. root worm
- c. black cutworm
- d. wire worm
- e. white grub
- D. What three questions can you ask to help determine the specific insect problem. (10 points)
- E. Corn borer was a problem last year.
 - 1. what cultural practice could be used to minimize first brood infestation this year? (4 points)
 - 2. Would you recommend this practice to a farmer? Explain your rationale. (4 points)
- F. You have scouted your corn field for corn borer at the late whorl stage. You sampled 10 plants in 10 locations in your field. You found an average of 1.9 borers per plant. Using the data in Table 1 (below) determine whether a chemical treatment at a cost of \$18.00/acre is justified. Corn is currently worth \$1.90/bu. Average yield last year was 155 bu/A. Assume your treatment will only control two thirds (66.7%) of the larva. (10 points)

Show your work

Table 1. Corn loss caused by European corn borer (ECB) for various corn growth stages (R.A.Higgens, R.E. Lynch and F.L. Poston).

Plant stage	Loss bu/A (ECB/plant)	% loss (ECB/plant)
Early whorl	7.7	5.5
Late whorl	6.2	4.4
Pretassel	9.2	6.6
Pollen shedding	6.2	4.4
Kernels initiated	4.2	3.0

Key

- 1-A C-triple super Phosphate
- 1-B 8 mph x 5280 ft/mi /2 min/60 min/hr = 1408 feet 1408 feet x 60 ft width = 84,480 sq ft
- 1-C $a = 33 \text{ lbs } \times 0.46 \times 0.43 = 6.5 \text{ lbs P/A}$
- 1-D a = 6000 lbs/cart / 33 lbs/A = 181 A
- 1-E $c = 30 \text{ lbs/A} / (0.45 \times 0.43) \times 72.2 = 11,194 \text{ lbs}$
- 2-A 28,000 / 90 germination / 0.9 emergence = 34,567 seeds/A
- 2-B $30 \text{ ft } \times 2.5 \text{ foot wide rows} = 75 \text{ sq ft/plot}$

$$\frac{43,560 \text{ sq ft/A}}{75 \text{ sq ft/plot}} = 5808 \text{ plots/A}$$

 $5808 \text{ plots/A } \times 36 \text{ plants/plot} = 20,908 \text{ pl/A}$

- 2-C c. black cutworm d. wire worm e. white grub
- 2-D a. What was the previous crop? (If sod, pasture, alfalfa, white grub likely problem check for root feeding injury)
 - b. Did plants emerge, then get cut off above the roots? Turn grey? (cutworm)
 - c. Were seeds tunneled? (If so wireworm)
 - d. What tillage system?
 - 1.) Spring plowed? (alfalfa or red-clover likely seedcorn maggot)
 - 2.) Fall plowed with heavy manure application? (seed corn maggot)
 - 3.) No till after soybeans in low areas? (wireworm)
 - e. Level of weed control last year? (No till with poor weed control and low area creates haven for cutworm)

State Crops Contest Grain Grading

Sample 1. Soybeans

Sample Information (1020 grams)

Contained 5 green garlic bulblet and 1.2 % whole corn and 0.3% cracked corn. The sample is discolored due to weathering. Odor is natural.

Work Sample (129 grams)

Test weight – 53.4 lbs/bu Moisture – 16.5 % Material through a 8/64 inch round hole sieve – 0.55% Badly ground damaged soybeans – 5.045% Soybean splits – 29.449% Black soybeans – 1.8%

Key

U.S. No. 3 Yellow Soybeans, Garlicky

Factors:

Test weight -53.4 Damaged kernels total -5.0% Splits -29.4% FM = Corn whole 1.2% = 0.3% cracked corn and material through 8/64-0.6% = 2.1%

Sample2. Wheat

Sample information (999 grams)
Sample mostly Hard Red Spring Wheat
Test weight of 59.2 lbs
Dockage 1.09%
Garlicky odor with 5 dry garlic bulblets
Odor of smut – 13 smut balls
Material through a 0.064 x 3/8 oblong sieve – 1.06%

Work sample (30 grams)

Heat damaged barley – 0.2% Sprout damaged wheat – 3.7% Wild oats – 0.846% Durum wheat – 2.8% Soft red winter wheat – 7.2% Hard and vitreous kernels – 62%

Key

U.S. No. 3 Northern Spring Wheat, light smutty, dockage 1.1%

FM - (other grain + other matter, 0.2% barley = 0.8% wild oat) = 1.0%

 $Defects(damaged\ wheat\ and\ other\ grains\ +\ other\ grains\ and\ FM\ (not\ dockage)\ +\ shrunken\ and\ broken)\ =\ (heat\ damaged\ barley\ 0.2\%\ +\ sprouted\ wheat\ 3.7\%)\ +\ (0.2\%\ barley,0.8\%\ wild\ oat)\ +(ShBk-1.1\%)\ =\ 6.0\%$

Contrasting class - Durum 2.8%

Wheat of other classes – Durum 2.8% + Soft Red Winter – 7.2%) = 10%

Sample 3. Oats

Sample information

Heat damaged barley – 0.22% Not heat damaged barley – 0.21%

Wild buckwheat weed – 0.81%

Cultivated buckwheat – 1.01%

Ergot - 0.18%

Material through a $0.064 \times 3/8$ inch sieve and on top of 5/64 triangular sieve -20.5%

Insect bored kernels – 0.945%

Wild oats - 2.045%

Key

U.s. No. 2 Extra Heavy oats, Ergoty, Thin

Sound oats – [100 – (other grain + damaged oats total + wild oats + FM) = 0.4 barley + 1.0 buckwheat +0.9% insect bored + 2.0% wild oats + 0.81% wild buckwheat + 0.5% material through 5/64] = 94.4% Heat damaged – 0.2%
